

UNDER CURRENT®

THE PROVEN PRODUCTION SYSTEM

ASSEMBLY INSTRUCTIONS

CURRENT
CULTURE H₂O[®]
CULTIVATION SOLUTIONS

THANK YOU!

Thank you for purchasing your Under Current® system. Your system was manufactured and packed with pride at our facility in Fresno, California.

Since 2006, the team at Current Culture H2O® has been dedicated to Cultivating Hydroponic Evolution. We uphold this mission by developing innovative and relevant products for growers worldwide. The Under Current® is just one example of our dedication and commitment to quality.

While using the Under Current® you will enjoy the benefits of increased efficiency, reduced maintenance and larger overall yields... just to name a few.

Your comments are important to us because they help us provide the best service in the industry. So please don't hesitate to drop us a line via phone, email, web or social media.

Again, thank you for your purchase.

GROWER SUPPORT

We want every Under Current® grower to experience outstanding results and huge yields. Your success is our success!

We have a unique team of seasoned growers and problem solvers with years of experience in hydroponics and traditional growing techniques. We offer expert grower support and will do our very best to troubleshoot your issues, big or small.

If you have any questions concerning our products or need help with your grow, please contact our Tech Support department in one of the following ways:

Online: Fill out our Tech Support form @ cch2o.com

Email: Send us an email describing your issue tech@cch2o.com

INSTRUCTIONS OVERVIEW

The Under Current Assembly Instructions are broken into 6 phases. Each phase outlines an important step in the overall system setup. By closely following these instructions you will ensure your system is properly installed and ready to #GROWTREES

1. Drain Out Kit
2. Re-Circulation System
3. Air Pump Bank
4. Aeration Manifold
5. System Initiation
6. Planting

PHASE 1: DRAIN OUT KIT

KEEP ALL ITEMS IN BAGS!
Do not open any kits or intermingle any items that are shipped separately.

Some items may not be used, this is normal.

1. Unbox. Place all parts adjacent to grow area. Move items into grow area as needed.
 - a. Modules, Epicenter, Module Plug Kits
 - b. Manifolds, Joints, Bulkhead Filters
 - c. Pump Kit, Wye Kit, Epicenter Kit
 - d. Return Pump, Return Hose
 - e. Air Pump, Air Flow Regulator, Air Supply Kit, Aeration Manifold Components, Air Stones
 - f. Lids and Net Pots

Move Growth Modules, Epicenter and Uniseals into grow area.

ALL GROWTH MODULES

EPICENTER BASE

2. Install $\frac{3}{4}$ " Uniseals into the hole at the base of each GROWTH MODULE and EPICENTER.

Align EPICENTER & ALL GROWTH MODULES with Uniseals/DRAIN OUT holes facing the same direction.

3. Layout GROWTH MODULES in your systems designated pattern, with EPICENTER at one end.

- a. Under Current (UC): Two Rows
- b. Under Current Evolution (UCE): Three Rows
- c. Under Current Double Barrel (UCDB): Four Rows

PHASE 1: DRAIN OUT KIT

Important Notes:

Drop Tees should always be oriented downward.

Drain Out Joints run parallel to module rows.

Drain Out Blunts run perpendicular to module rows.

2-Row

3-Row

4-Row

4. Layout all parts of the DOK System in area adjacent to grow area. Group all Hose in relative lengths.

5. Lay out Joints along-side system, barbed end of Drop Tee facing Return Manifold

6. Layout a row of Joints for each corresponding row of the system being assembled. Example: Evolution has 3 rows, layout 3 rows of joints.

7. Begin each row of joints with a Drain Out Joint Short (shortest joints included in DOK Fitting Kit), which should be positioned nearest the Epicenter .

PHASE 1: DRAIN OUT KIT

*BE CERTAIN THE PRINT ON THE DRAIN HOSE ALIGNED.

8. Attach all joints in series by pushing open end of drain hose onto the corresponding drop tee in series.

9. Move each row of aligned Drain Out Joints along-side the corresponding row of Growth Modules. Place on the Drain Well side of the row of Growth Modules.

10. Install all Drop Tees into Uniseals at the base of the GROWTH MODULE. Push in until fully seated or until DROP TEE stops. Repeat for all Drop Tees and GROWTH MODULES.

11. Layout Drain Out Blunts and 1" fittings (located in the Drain Out Fitting Kit) on the Delivery Manifold end of the system. Connect all parts to create the Drain Out Delivery Manifold.

a. *If assembling a Double Barrel (4 Row) system: (2) designated Center Drain Out Blunts (denoted with colored rubber band) will need to be connected with a 1" Tee and laid out on the Delivery Manifold.

PHASE 1: DRAIN OUT KIT

12. Install the Drain Out Delivery Manifold to the corresponding Drain out Joints.

13. Attach the Epi Joint (located in DOK valve kit) to the open barb on Tee/Cross fitting on the delivery side of the DOK manifold. Pick one:

- a. Short – 8 gallon
- b. Long – 13 gallon

14. Install the DOK Valve Assembly (with attached Drop Tee) onto the Epi Joint. Install the Drop Tee into the Uniseal at the base of the Epicenter.

15. Install 1" caps on barbed ends of Drop Tees at end of system near return manifolds.

Drain Out Kit is Complete!

PHASE 2: RE-CIRCULATION SYSTEM

If assembling a BONELESS system, follow BULKHEAD instructions included in BONELESS KIT. See BONELESS CUT CHART on page 46.

1. If assembling standard system, carry on with instructions.

Move all Joints, Manifolds and Bulkhead Filters into grow area.

Do not remove all bulkhead nuts, only remove the nuts on the joint or manifold you are about to install. Do not remove gasket from bulkhead when removing nut.

2. Layout all Joints and Manifolds relative to placement in system alongside corresponding GROWTH MODULES.

3. Connect all GROWTH MODULES with JOINTS.

- Seal the bulkhead in the hole so that the gasket is flat and tight against the outside of the module wall.
- Install the Bulkhead Nut on the inside of the Growth Module, hand-tighten.

PHASE 2: RE-CIRCULATION SYSTEM

If assembling a 2-row system, skip this step.

CAUTION: Using PVC/ABS glue will VOID the warranty on your DELIVERY/RETURN MANIFOLDS.

4. Assemble Delivery Manifold for 3-Row (Evolution) and 4-Row (Double Barrel) Systems:

- Loosen the small clamp on the rubber sleeve.
- Fully seat the pipe into the female tee socket.
- Slide sleeve over to fully cover socket.
- Align all Bulkheads horizontally to ensure proper orientation to Growth Modules.
- Once orientation is achieved, tighten clamp screws on both sides of rubber sleeve.

Visually inspect the outside connection for gaps, if you see any gaps loosen and re-seat the Main Bulkhead Body.

5. Install DELIVERY MANIFOLD into EPICENTER.

- Insert the center Bulkhead of the DELIVERY MANIFOLD into the EPICENTER, seat the bulkhead in the hole so that the gasket is flat and tight against the outside of the module wall.
- Install the Bulkhead Nut on the inside of the EPICENTER and hand-tighten.

6. Connect DELIVERY MANIFOLD to first row of GROWTH MODULES.
 - a. Insert the Bulkhead of the DELIVERY MANIFOLD into the first row of GROWTH MODULES, seat the bulkhead in the hole so that the gasket is flat and tight against the outside of the module wall.
 - b. Install the Bulkhead Nut on the inside of the Growth Module, hand-tighten.

Move Pump Kit, Epicenter Kit and Wye Kit (only for 3-row and 4-row systems) to grow area.

Do not excessively tape (no more than 3 revolutions) or over-tighten the threaded nipple.

7. Use Thread Tape (located in Instructions Kit) on male nipple of 1" Valve (Located in PUMP KIT).

PHASE 2: RE-CIRCULATION SYSTEM

Do not excessively tape (no more than 3 revolutions) or over-tighten the threaded nipple.

8. Install 1" valve into the 1" elbow on the bottom of the RETURN MANIFOLD. Blue valve handle should be facing up.
 - a. *For Evolution (3-row) or Double Barrel (4-row) systems repeat these steps for the second valve. (Located in WYE FITTING KIT)

9. Install RETURN MANIFOLD(S) to last row of GROWTH MODULES. 1" Valve Assembly on Return Manifold should be oriented in a downward position. Install the Bulkhead Nut on the inside of the Growth Module, hand-tighten.
 - a. *For Double Barrel Systems repeat this step for the second RETURN MANIFOLD.

For 8-gallon systems skip this step.

10. For 13 Gallon Systems place MANIFOLD CRUTCH(S) under DELIVERY MANIFOLD piping at both corners.

11. Install BULKHEAD FILTERS inside the last row of GROWTH MODULES into RETURN MANIFOLD BULKHEADS.

PHASE 2: RE-CIRCULATION SYSTEM

Move RETURN PUMP, 1" RETURN Hose and Add Back Kit to grow area.

12. Remove RETURN PUMP from box. ****Discard stock filter included with RETURN PUMP.**

13. Install RETURN PUMP fittings (Located in PUMP KIT).

- Identify the correct inlet/outlet fittings for your pump.
- Tape ALL Male Fittings and Pump Outlet.
- Install PUMP INLET & OUTLET fitting(s) onto RETURN PUMP.

14. Install Straight Section of OUTLET HOSE (Located in PUMP KIT) onto Return PUMP OUTLET barb. Install clip-clamp.

15. Install Epi Stem in EPICENTER:

- a. Install $\frac{3}{4}$ " Uniseal (Located in Pump Kit) into the hole at the top of the EPICENTER.
- b. Insert Epi Stem through Uniseal. *Be sure nipple on stem is fully inserted into Uniseal and bottomed out.
- c. Install elbow inside Epicenter on Epi Stem Nipple, direct outlet down.

PHASE 2: RE-CIRCULATION SYSTEM

16. Position RETURN PUMP with outlet hose next to EPI STEM barb. Cut hose to length. Attach hose to barb and secure with clip clamp.

For 2-row systems skip this step.

17. Install Wye Fitting to barb on pump inlet.

CAUTION: Measure twice before cutting hose.

18. Install RETURN HOSE(S).

- Attach 1" Return Hose to 1" Valve on Return Manifold.
- Run Return Hose to Return Pump, cut to length.
- Attach to RETURN Pump Inlet.
- * For 3-Row (Evolution) and 4-Row (Double Barrel) Systems repeat process for second Return Hose attach to Wye Fitting.

Make sure FLOAT VALVE is oriented correctly.

19. Install Float Valve (located in Epicenter Kit).

- Unscrew Nut from float valve.
- Install FLOAT VALVE into lower/central hole with rubber washer on inside EPICENTER. Secure with plastic nut, tighten nut down completely to ensure a good seal.
- Apply thread tape to male threads on float valve.

PHASE 2: RE-CIRCULATION SYSTEM

DO NOT adjust wing nut on Float Valve.

20. While holding FLOAT VALVE firmly in place. Screw on FLOAT VALVE QUICK CONNECT fitting (located in Epicenter Kit). Tighten until fitting no longer rotates. Orient the 1/2" Elbow downward. *See Page 39 for Reservoir Installation Instructions.

DO NOT OVER TIGHTEN.

21. Use the included BULKHEAD WRENCH to tighten all Bulkhead Fittings. 1/4 - 1/2 turn ONLY.

22. Inspect all system connections. Ensure that bulkhead gaskets are flush against module wall with NO gaps.

Re-Circulation System is Complete!

PHASE 3: AIR PUMP BANK

Air Pump Bank Location Guidelines

Before choosing the ideal location for the system's Air Pump Bank (APB) please consider the following:

- Make sure the area has adequate electrical service
- Locate the APB outside the grow area if possible
- Make sure the area is free of any potential electrical hazards
- Recommended mounted height:
 - o 60" off floor is ideal if mounted inside grow area
 - o 36" off floor is ideal if mounted outside grow area
- Make sure the area is properly ventilated
- Make sure the area is clean and free of dust/debris
- Distance from APB to system's Aeration Manifold:
 - o The APB should be located no further than 15ft. from the system's Aeration Manifold connection.
 - o **If further than 15ft., larger diameter delivery plumbing will be needed.*

Move Air Pump(s), Air Flow Regulator and Air Supply Starter Kit to grow area.

1. Unbox air pumps. Attach factory supplied $\frac{3}{4}$ " rubber elbow to outlet on each air pump.

2. Attach (1) Air Pump Inlet Tee (APIT) to each air pump in the pump bank.

PHASE 3: AIR PUMP BANK

3. Adjoin each APIT in series. Connect outlet hose to the inlet barb on the following APIT.

4. Attach 1" cap to open inlet barb on APIT.

5. Unbox Air Flow Regulator (AFR). Attach Relief Outlet to Valve.

6. Connect outlet hose on first air pump in series to the inlet barb on the AFR.

7. Plug all Air Pumps into a heavy-duty surge protector (GFI Recommended).

Air Pump Bank with Air Flow Regulator is Complete!

PHASE 4: AERATION MANIFOLD

Move Aeration Manifold Joints, Aeration Blunts, Aeration Leads, Air Manifold Fittings and Air Stone Kits to Grow Area.

1. Layout all parts of the Aeration System in area adjacent to grow area. Group all Pipe in relative lengths.

2-Row

MANIFOLD FITTINGS - BASE KIT

3-Row

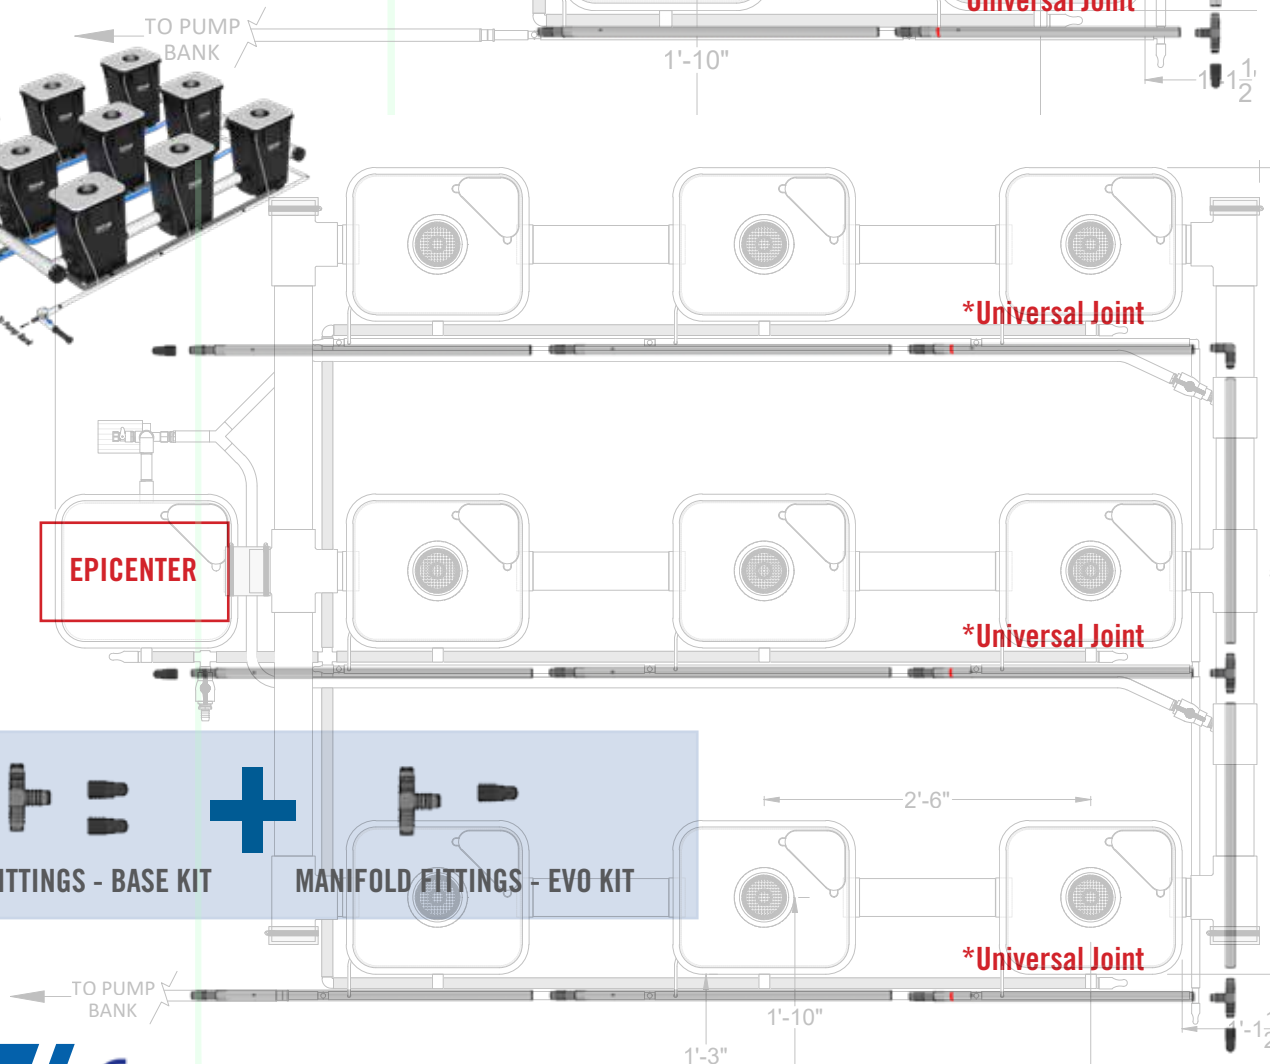

EPICENTER

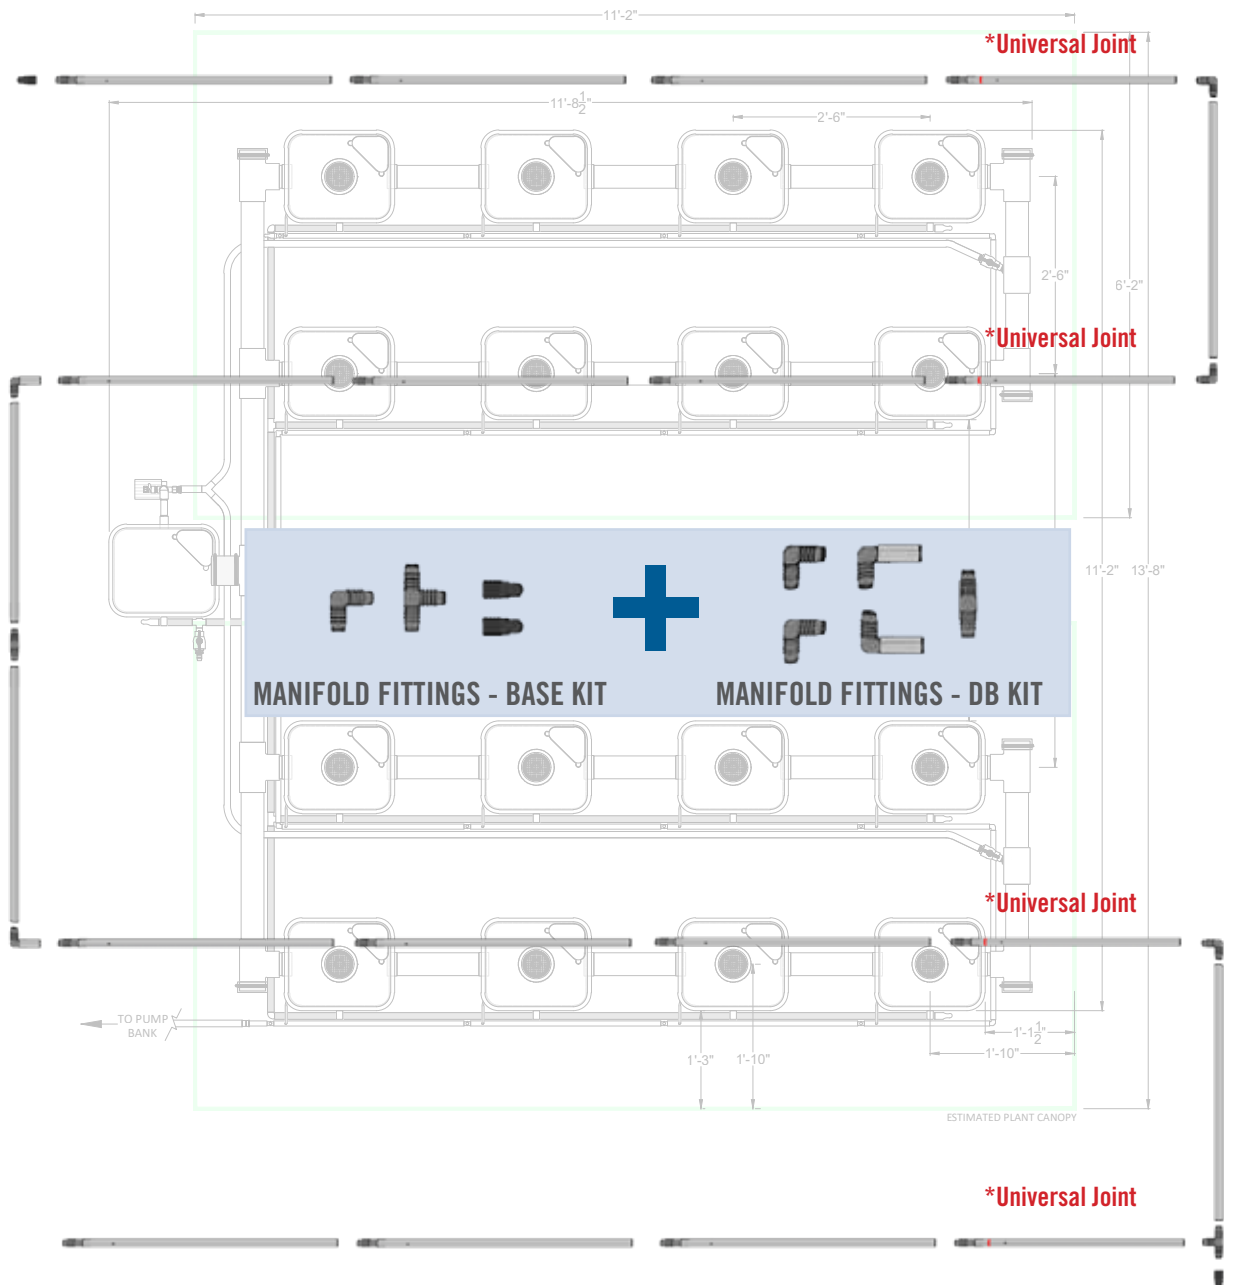

MANIFOLD FITTINGS - BASE KIT

MANIFOLD FITTINGS - EVO KIT

PHASE 4: AERATION MANIFOLD

2. Lay out Aeration Joints alongside system, with barbed end facing Epicenter. ****System shown with OPTIONAL Add-Back Kit.**
 - a. Layout a row of Aeration Joints for each corresponding row of the system being assembled. Example: Evolution has 3 rows, layout 3 rows of joints.
 - b. Begin each row of Aeration Joints with a UNIVERSAL JOINT (denoted with colored rubber band). The UNIVERSAL JOINT should be positioned nearest the Return Manifold.

Be certain the print on the aeration pipe is aligned and facing down.

3. Attach all joints in series by pushing open end of aeration pipe onto the corresponding barb.

4. Install all Aeration Leads. Insert barded end of ¼" Aeration Lead into predrilled holes in the Aeration Joints. Make sure barb is fully seated in hole.

5. Move each row of connected Aeration joints alongside the corresponding row of Growth Modules. Aeration Joints should be placed on the Drain Well side of the row of Growth Modules. ****System shown with OPTIONAL Add-Back Kit.**

PHASE 4: AERATION MANIFOLD

6. Layout Aeration Blunts, perpendicular to each row of Aeration Joints on the Return Manifold end of the system.

a. ****If assembling a Double Barrel (4 Row) System:** (2) designated Aeration Blunts will need to be connected with $\frac{3}{4}$ " barb and laid out on the Delivery Manifold side between the 2 most internally positioned rows. *SEE OVERVIEW ON PAGE 26.

7. Using Aeration Fitting Kit ($\frac{3}{4}$ " tees/elbows), connect the Aeration Blunts to the corresponding Aeration Joints to create the completed Aeration Manifold.

8. Insert grommets (Located in AIR STONE KIT) into air inlet hole near the upper lip of the GROWTH MODULE. Repeat for all GROWTH MODULES.

9. Remove AIR STONES (Located AIR STONE KIT) from packaging. Place in base of GROWTH MODULE.

PHASE 4: AERATION MANIFOLD

10. Push Aeration Lead (attached to Aeration Manifold) through the side entry hole in GROWTH MODULE. Connect to Air Stone and position in center of GROWTH MODULE. ****System shown with OPTIONAL Add-Back Kit.**

11. Connect Aeration Manifold to Air Pump Bank with Air Flow Regulator.
- Connect $\frac{3}{4}$ " section of Air Supply Hose to any open $\frac{3}{4}$ " barb on the Aeration Manifold. Choose the inlet location nearest the Air Pump Bank with Air Flow Regulator.
 - Attach opposite end of 1" Air Supply Hose to the outlet barb on the Air Flow Regulator.

12. Apply $\frac{3}{4}$ " caps to any open barbs throughout the Aeration Manifold.

Aeration Manifold is Complete!

System Assembly is Complete!

PHASE 5: SYSTEM INITIATION

1. Aeration System Startup & Priming

- a. Before adding water to system, power up pump bank and initiate aeration. Beginning aeration before submersing air stones aides in priming the aeration system for optimal output.
- b. ***Aeration System output is measured using the metric of “inches water column” (IWC). This measurement provides a useful standard for establishing output baselines for operating your UC system.
- c. With AFR bleed valve in the fully closed position, Initiate power to the air pump bank
- d. Run without water.

2. Test Fill & Leak Check

- a. Begin filling system with water.
- b. Once system has reached desired capacity, observe reading on gauge
- c. ***Test fill system to just above BULKHEADS, check for leaks. Run return pump for 1 hour, re-check often for leaks. Adjust and tighten BULKHEADS as necessary. If a leak is discovered and you're unable to fix, call CCH2O @ 559-266-4769 for support.

3. Aeration Calibration

- a. Target gauge reading for the Air Flow Regulator is 20-25 IWC
- b. To calibrate the IWC to the target setting, slowly open bleed valve and observe IWC begin to fall
- c. Once needle on gauge reads 20-25, simply leave bleed valve in this set position
- d. Pump bank and aeration system is calibrated and ready for operation
- e. ***Do not turn off air pumps while air stones are submersed. Doing so can result in a siphon action that will pull nutrient solution and debris into air stones rendering them less effective. Always remove air stones from the nutrient solution before disengaging pump.

PHASE 6: PLANTING

1. Install LIDS

- Install Lids to each GROWTH MODULE, install PORT HOLE COVER(S) on each LID.
- Install EPICENTER LID on EPICENTER.

2. Add Nutrients

- Add desired nutrient(s) to Epicenter.
 - Adjust your nutrient strength to week 1 of Veg on the Cultured Solutions Feeding Schedule, see pg. 47.

3. pH Balancing (Without Plants in System)

- Add desired pH adjuster slowly to Epicenter. Dilute as needed.
- Allow solution pH to stabilize (Approx 15-30 mins).
- Once solution is balanced, introduce plants.

4. Introducing Plants into the Under Current

- Rinse grow rocks/stones thoroughly before use.
- Rest bare root seedling/cutting on planting deck, drape exposed roots over planting deck towards the bottom of the NET POT.
- Gently fill around the seedling/cutting roots up to about 1" from the top lip of NET POT.
- Place NET POT into the LID on top of each GROWTH MODULE.

RESERVOIR INSTALLATION

CCH2O TIP:

A top-off reservoir is used to maintain consistent system volume. The top-off reservoir also helps to keep water chemistry stable. Fluctuations in pH and EC can have a negative effect on plant health.

The Top-off reservoir will supply solution via gravity to the float valve in the Epicenter (control module). When operated properly, the top-off reservoir should be balanced to be the same or slightly higher as the nutrient solution in the system.

Reservoir Installation

1. Attach a top-off reservoir to the FLOAT VALVE using the RESERVOIR ADAPTER KIT.

a. Drill 1-1/4" hole near base of desired reservoir, install UNISEAL and RESERVOIR ADAPTER. Connect RESERVOIR ADAPTER to FLOAT VALVE QUICK CONNECT ELBOW with RESERVOIR HOSE.

b. Reservoir should be elevated above EPICENTER.

c. RESERVOIR HOSE can be lengthened to place reservoir further away from EPICENTER.

CHILLER INSTALLATION

Water Chiller Installation

The Under Current® can easily be adapted to a water chiller in one of the following ways:

1. Remove the upright hose section of the PUMP KIT, attach 1" hose (not included) from the output barb on the RETURN PUMP to the chiller inlet. Attach 1" hose (not included) from the chiller outlet back to the 1" barb on the EPI STEM.
2. For cooling multiple Under Current® systems with one large centralized chiller we recommend a cold-water loop with stainless-steel heat exchangers, see below. One heat exchanger is needed for each system/EPICENTER. Contact our commercial sales team for more information: sales@cch2o.com

Spot Chiller Example

Heat Exchanger Example

Centralized Chiller Cold Water Loop Example

Draining the System without the DRAIN OUT KIT

Draining the system can be done in two ways:

1. Attach a garden hose to the GARDEN HOSE DRAIN ADAPTER (in PUMP KIT). Remove the elbow from the EPI STEM inside the Epicenter and replace with the GARDEN HOSE DRAIN ADAPTER. Direct the garden hose to your desired drain location. Monitor water level as system drains to not let RETURN PUMP run dry.
 - a. This will drain system to within 1". Top off system with fresh water while draining to dilute remaining solution.
2. Turn OFF system's circulation pump. Remove cap from DRAIN VALVE at base of EPICENTER. Attach female side of garden hose to DRAIN VALVE. Run garden hose to desired location (Preferably a lower elevation than the DRAIN VALVE). Open DRAIN VALVE.
 - a. This will drain system to within 1". Top off system with fresh water while draining to dilute remaining solution.

Draining the System with the DRAIN OUT KIT

The DRAIN OUT KIT can be used with or without a TRANSFER PUMP:

1. Without Pump: Turn OFF system's circulation pump. Attach a GARDEN HOSE to the DRAIN OUT KIT VALVE. Run garden hose to desired location (Preferably a lower elevation than the VALVE). Open DRAIN OUT KIT VALVE.
2. With TRANSFER PUMP: Attach TRANSFER PUMP to the DRAIN OUT KIT VALVE. Attach GARDEN HOSE to TRANSFER PUMP. Run TRANSFER PUMP hose to desired location. Open DRAIN OUT KIT VALVE. Turn on TRANSFER PUMP. Monitor water level as system drains to not let TRANSFER PUMP run dry.

CLEANING & SANITIZING

Products

ZeroTol 2.0
is a **Hazardous**
Material:
recommended for
commercial
applications only.

ZeroTol HC
is a **Non-Hazardous**
Material:
recommended for
residential
applications.

DO NOT USE WITH PLANTS

Personal Protective Equipment (PPE)

Always use the appropriate PPE, for detailed recommendations review the BioSafe website @ www.biosafesystems.com
Personal Protection Equipment is also listed on BioSafe Systems Product Labels.

Calculating System Volume & Dilution Ratios

8 Gallon Systems: Total # of Growth Modules + Epicenter X 6.6 gallons. Example: (12 Growth Modules + 1 Epicenter) = 13 X 6.6 = 86 gallons

13 Gallon Systems: Total # of Growth Modules + Epicenter X 11 gallons. Example: (24 Growth Modules + 1 Epicenter) = 25 X 11 = 275 gallons

1:100 Ratio: Divide system volume by 100. Example: 275 gallon system volume ÷ 100 = 2.75 gallons ZeroTol

1:150 Ratio: Divide system volume by 150. Example: 275 gallon system volume ÷ 150 = 1.83 gallons ZeroTol

1:250 Ratio: Divide system volume by 250. Example: 275 gallon system volume ÷ 250 = 1.1 gallons ZeroTol

1:300 Ratio: Divide system volume by 300. Example: 275 gallon system volume ÷ 300 = 0.92 gallons ZeroTol

1:500 Ratio: Divide system volume by 500. Example: 275 gallon system volume ÷ 500 = 0.55 gallons ZeroTol

Post-Harvest Under Current® System Sanitization

1. Remove plants, root masses, and all debris from the system.
2. Turn off circulation pump, leave air pump(s) running.
3. Pull air stones from the system and set aside for separate disinfection process.
4. Turn off the air pump(s).
5. Top off system to full capacity with water.
6. Add ZeroTol 2.0 or HC - *For best results introduce ZeroTol solution at multiple points throughout the system.
7. Recommended dosage:
 - ZeroTol 2.0
 - o 1:500 ratio (for normal post-harvest residual)
 - o 1:250 ratio (for heavy sedimentation or bacterial residuals)
 - ZeroTol HC
 - o 1:300 ratio (for normal post-harvest residual)
 - o 1:150 ratio (for heavy sedimentation or bacterial residuals)
8. Initiate circulation pump.
9. Allow solution to circulate for 2 hours.
10. Turn off circulation pump, let solution sit for 30 minutes.
11. Drain the system completely via drain out plumbing.
12. Wipe airlines to remove any nutrient films (use dilute ZeroTol solution). *Continue on next page —>*

CLEANING & SANITIZING

Post-Harvest Under Current® System Sanitization (continued)

13. Drain or wet vac away any remaining solution as needed.
14. Wipe down outside of growth modules, water hoses, epicenter and adjacent components (use dilute ZeroTol solution).
15. Allow system to air dry.
16. Process complete, the system is now ready for use.

CCH20 Lid and Net Pot Sanitization

1. Fill large tub (large enough to fit desired contents) with water.
2. Add ZeroTol 2.0 or HC
3. Recommended dosage:
 - ZeroTol 2.0
 - o 1:100 ratio (for normal post-harvest residual)
 - ZeroTol HC
 - o 1:150 ratio (for normal post-harvest residual)
4. Allow lids and net pots to soak for 15 minutes.
5. Remove from solution and allow to air dry.
6. No rinse is needed.

Airstone Sanitization

1. Remove airstones from 1/4" air lines.
 2. Fill large tub (large enough to fit desired contents) with water.
 3. Add ZeroTol 2.0 or HC
 4. Recommended dosage:
 - ZeroTol 2.0
 - o 1:100 ratio (for normal post-harvest residual)
 - ZeroTol HC
 - o 1:150 ratio (for normal post-harvest residual)
 5. Allow airstones to soak for 2-4 hours.
 6. Remove and rinse with clean water.
 7. Allow to air dry completely before being reused (60+ days is recommended).
- *Airstones should be rotated from cycle to cycle.**

Floor & Wall Sanitization

1. Sweep or vac away all plant debris.
2. Fill sprayer with water.
3. Add ZeroTol 2.0 or HC
4. Recommended dosage:
 - ZeroTol 2.0
 - o 1:300 ratio (for normal post-harvest residual)
 - ZeroTol HC
 - o 1:150 ratio (for normal post-harvest residual)
5. Spray all floors, walls and surfaces.
6. Allow to solution to sit for 15 minutes.
7. *Optional: Mop floor and wipe surfaces with clean water.
8. Allow to air dry.

***After use, this non-toxic sanitization solution can be sent down municipal drains. Solution breaks down into oxygen and water.**

MAINTENANCE & DISPOSAL

Replacement Items

Replacement parts are available through all CCH2O Authorized Dealers. These items are not covered under our Limited 3-year Warranty and should be replaced regularly to maintain system performance and cleanliness. Most items can be cleaned and re-used with each successful run. If any items become damaged or you are unable to clean them sufficiently they should be replaced.

- **Net Pots** – Net pots should be replaced as needed. Net pots can be cleaned and re-used in most cases. If net pots become damaged or are unable to properly support plants they should be replaced.
- **Air Stones** – Air Stones should be replaced with each full run. Air Stones can clog or harbor bacteria and pathogens if not cleaned properly between runs. Replacing the Air Stones will allow for maximum aeration with the least back pressure.
- **Air Hose Leads** – Air hose leads should be replaced as needed. Replace air hose leads if lines become kinked or damaged and air levels start diminish.
- **Return Hose** - Return hose should be replaced as needed. Return hose can harbor bacteria and pathogens if not cleaned properly between runs. Replace return hose if lines become kinked or damaged and flow levels start to diminish.

System Disposal & Recyclable Items

Each component of the Under Current system has been chosen for longevity and durability in adverse growing environments. Though we offer a Limited 3-year Warranty, most of your systems components have been optimized for a much longer life. In our pursuit of a fully recyclable system we've worked hard to source parts that are made from re-usable plastics. In the event you plan on disposing of your systems components please use the following information to do so responsibly:

- **Modules** – Made from food grade Polypropylene. Can be recycled.
- **Lids, Net Pots, Bulkheads** – Made from Recycled ABS. Can be recycled.
- **Joints** - Made from virgin ABS. Can be recycled.
- **Manifolds** – Bulkheads and straight pipe are ABS and can be recycled. Elbows and tees are PVC and can be recycled but only through specialty recycler.
- **Air Hose/Aeration Manifold** - Made from EVA. Can be recycled.
- **Return Hose** - Made from FPVC. Can be recycled but only through specialty recycler.

BULKHEAD INSTALLATION

*FOR BONELESS APPLICATIONS

UC Spin-Tight Bulkhead - Assembly and Installation Recommendations

Thank you for purchasing our UC Spin Tight Bulkheads. To ensure your bulkheads function properly, follow the instructions below for installation. In the event you have a question, please contact us at tech@cch2o.com

*****NOTE: Take extra precautions and educate yourself when working with the tools and supplies necessary to bond and plumb plastic and bulkheads correctly. Consult with an online plumbing tutorial if further insight is necessary on the specifics of cutting and fitting pipe.**

DRILLING

Be certain to take great care in drilling your holes! An improperly drilled hole will result in a poor seal and leakage. When drilling holes in containers to accept UC Spin Tight Bulkheads, we recommended drilling the following sizes:

2" Bulkhead = 2-7/8" Hole

3" Bulkhead = 3-7/8" Hole

GLUING

UC Spin Tight Bulkheads are made of ABS plastic and designed with one male threaded connection (which enters hole in module) and one socket side which is designed to accept 2" or 3" schedule 40 PVC. To make this pipe to bulkhead connection, we recommend the appropriate glue be used relative to the pipe material being installed.

ABS to PVC: If connecting to PVC use glue suitable for bonding ABS to PVC. We recommend WELD ON ABS/PVC GLUE 794.

ABS to ABS: If connecting to ABS use glue suitable for bonding ABS to ABS. We recommend WELD ON ABS GLUE 773.

If these glues are not available, use whatever comparable substitute you can source.

INSTALLATION

Factors such as hole distortion, un-level floors and inattention to detail can all play a roll bulkheads not functioning properly. For best results be cautious, take your time and use care when installing UC Spin Tight Bulkheads. Always consult a professional if necessary.

*****NOTE: Do NOT use and lubricants or adhesives on the UC Spin Tight Bulkhead during the installation process.**

- 1) Press flat gasket down to fully seat and install on flat flange on the outside of the bulkhead body. Be certain the gasket is fitted onto the flange as improper fitting will lead to leaks.
- 2) Insert male threaded side of bulkhead through the hole in your container and press the fitted gasket firmly against the side wall of container. Visually inspect for gaps.
- 3) Place Bulkhead Nut on male threads and hand tighten.
- 4) Once all bulkheads are installed using steps 1-3, follow up by tightening nuts with supplied bulkhead wrench until firmly secured. Do not over tighten as this may lead to leakage.
- 5) Once properly installed you can now begin to fill your containers with fluid to check for leaks. For initial inspection, we recommend filling to just above the top of bulkhead and let stand for a half hour before continuing inspection. If a leak is discovered, you can use the bulkhead wrench to tighten further.
- 6) If additional tightening does not remedy seal it may be necessary to repeat steps 1-4 again to reseal bulkhead properly. If issues persist, please contact CCH2O Tech Department for more assistance.

TEMP	72	70	70	68	68	68	68	68	68	68	66	64	64

GENERAL USAGE INSTRUCTIONS

- Amounts are measured in milliliters per gallon of water.
- Dilute nutrients before mixing with other formulas, DO NOT MIX CONCENTRATES.
- Clean measuring cup thoroughly between nutrients.
- Use nutrient solution immediately after mixing or keep nutrient solution circulated.

STARTING WATER

Recommended source water PPM 0-20. Use reverse osmosis filtered water for best results. When using reverse osmosis water add Cultured Solutions® COCO CAL to the nutrient solution at recommended dosage.

PH LEVELS

Recommended source water pH 6.5 - 7. Optimal solution pH range after nutrients are added is 5.5 - 6.5. Adjust as necessary to achieve desired range.

GENERAL RECOMMENDATIONS

Plant Growth Stage !	Rooted Cutting/Lateral Branchin/Leaf Structure			Flower Set/Formation			Flower Stacking/Building			Flower Maturation/Ripening			Final Ripening	Flush
Weeks !	1	2	3	1	2	3	4	5	6	7	8	9	7 Days	2-3 Days
Day Temp (F°)	82°	82°	80°	80°	78°	76°	76°	74°	73°	73°	72°	72°	70°	64°
Night Temp (F°)	70°	70°	70°	68°	66°	64°	64°	62°	61°	61°	60°	60°	60°	60°
Day Relative Humidity (%)	75%	70%	60%	60%	55%	55%	55%	50%	50%	45%	40%	40%	30%	25%
Night Relative Humidity (%)	60%	55%	45%	45%	40%	40%	40%	35%	35%	35%	35%	30%	20%	0-20%
pH	6.3	6.2	6.1	6.0	6.0	5.9	5.9	5.8	5.8	5.8	5.8	5.8	5.7	5.7
EC	0.2	0.35	0.6	0.65	0.85	1	1.2	1.3	1.4	1.4	1.2	0.9	0.8	0
CO2 (ppm)	1000	1250	1500	1400	1300	1200	1100	1000	900	800	700	600	300	300
Water Temp (F°)	72°	70°	68°	68°	68°	68°	68°	68°	68°	66°	64°	64°	62°	60°

Environmental Considerations: For best results, all aspects of the grow space should be optimized including: day and night temperatures, humidity, light levels, CO2 and air movement. Refer to the CCH20 General Recommendations chart above for specific environmental parameters.

Nutrient Solution Temperature: Maintain nutrient solution temperatures between 66° - 72°. This will allow for the highest levels of dissolved oxygen, discourage proliferation of harmful bacteria and ensure explosive root growth.

Top-Off Reservoir: Use a top-off reservoir to maintain consistent water levels in your hydroponic system. The top-off can be used for nutrient/pH steering or rapid nutrient change outs.

Adjusting pH & EC/ppm: Use one of the following methods for pH and EC/ppm adjustments. Stay within our recommended pH and EC/ppm ranges for each week of veg and bloom.

Method 1 - Add-Back Kit (ABK): Dilute desired add-back concentrates 1 to 10 with water before initiating Add-Back. Close the valve on the ABK slowly. For more information on this method reach out to tech@cch20.com

Method 2 - Top-Off Reservoir: Using a top-off reservoir makes it easy to follow weekly feeding schedules. The top-off reservoir should have a similar nutrient concentration than what's in your hydroponic system or the following weeks nutrient schedule. For best results pH and EC/ppm adjustments should be done through the top-off reservoir.

Method 3 - Nutrient Doser: Use the CCH20 Nutrient Dosing System to automatically manage pH, PPM and ORP levels in your Under Current system.

*When implementing nutrient dosing or fertigation equipment be sure to consult your equipment manufacturer for the proper concentration ratios.

*UC ROOTS can be added directly to the your hydroponic system at recommended rates, it has no negative impact on plants/roots.

Nutrient Change Outs: Full nutrient change outs are beneficial every 7-10 days. If pH levels become unstable or nutrient levels start to rise this may be a good indication to do a full or partial nutrient change out.

CAUTION: Adding organics, sugars, bacteria, and enzyme products have shown to promote biofilms which destabilize pH and require more frequent nutrient change outs.

System Setup

1. Can I integrate a water chiller?
 - a. Yes, refer to Instructions
2. Can I integrate a nutrient auto dosing system?
 - a. Yes. Visit the Automation section on our website for more information.
3. Can I add a top-off reservoir?
 - a. Yes, refer to Using a Top-Off Reservoir. Setup info: refer to Under Current Instructions
4. Can I have my air pump(s) on the floor?
 - a. No
5. Can I have my air pump(s) in the room with supplemented CO₂?
 - a. No
6. Can I run multiple Under Current® systems with one air pump?
 - a. Yes. Contact Us.
7. Can I operate my Epicenter remotely?
 - a. Yes, contact us.

System Operation

1. Is it possible to over-aerate my Under Current?
 - a. Yes
2. Do I need to use Reverse Osmosis (RO) water in my Under Current?
 - a. Yes
3. Should the Air Pump and Water Pump run 24/7?
 - a. Yes
4. How do I find my total system volume?
 - a. Reference the Systems Specifications on the Under Current Products page @ cch2o.com
5. Where should I set my solution level?
 - a. Bare Root: Top of root crown.
 - b. Rockwool/Cube: Just below base of RW/cube 1/4-1/2" below NET POT planting deck.
6. What nutrient solution temperatures are optimal?
 - a. 65-68 degrees F. Refer to General Recommendations for more info.

Grow Media

1. What grow mediums are recommended for use in the Under Current?
 - a. Expanded clay pellets and Growstones
2. Can I use soil or coco in the system?
 - a. No
3. How do I prepare my grow media?
 - a. Refer to manufacturer's recommendations.
4. Can I reuse my grow media?
 - a. Refer to manufacturer's recommendations.

Transplanting

1. Should I transplant sparsely rooted clones into the system?
 - a. No
2. Do I need to top-feed newly transplanted clones?
 - a. No, when clones are well rooted and planted as directed. Refer to Water Level info.
3. Can I move plants from an 8-gallon system to a 13-gallon system?
 - a. Yes
4. Can I veg in the dual/quad lids and transplant to single lids?
 - a. Yes, refer to Veg Guidelines
5. Should I dim/raise my lights after transplanting?
 - a. Yes, generally, for the first 24-48 hrs.

Nutrients & Change Outs

1. What is the best nutrient for the Under Current system?
 - a. Cultured Solutions
2. What is the recommended nutrient strength for the Under Current?
 - a. Refer to the Cultured Solutions feeding schedule
3. How frequently should I change my nutrients?
 - a. Every 7-10 days
4. Should I use Coco Cal (Ca/Mg) in the Under Current?
 - a. Yes, refer to the Cultured Solutions feeding schedule
5. Are Carbohydrates/Sweeteners, Enzymes and Beneficial Bacteria recommended in the Under Current?
 - a. No.

Nutrient Schedules

1. What feeding schedule should I use for my Under Current®?
 - a. Use the High Yield Recirculating Hydro feeding schedule.
2. Can I add weeks to my feeding schedule?
 - a. Yes
 - i. To extend VEG repeat week 4
 - ii. To extend BLOOM repeat week 5
3. At what nutrient strength should I maintain my Mother plants?
 - a. Maintain VEG Week 4 (approx. 325-455PPM) of the High Yield Recirculating Hydro feeding schedule.

pH Adjusting

1. How do I adjust pH?
 - a. Refer to the General Recommendations under Adjusting pH & EC/ppm
2. Can I use both pH UP and pH DOWN if I've overshot my desired pH level?
 - a. No, dilute with water and/or wait at least 24hrs.

Flushing

1. Do I need to flush my system before harvest?
 - a. Yes, refer to the Cultured Solutions feeding schedule
2. Do I need to flush my system between change-outs?
 - a. No

Cleaning

1. Do I need to fully disassemble my system to clean it?
 - a. No
2. What should I use to clean the system?
 - a. Refer to Sanitization Process.
3. Do I have to replace any parts after harvest/cleaning?
 - a. Typically No, when the proper Sanitization Process has been completed.
*Though some growers will replace net pots and air stones as needed.

Plant Maintenance/Trouble Shooting

1. Should I root prune?
 - a. Yes, contact us for more info.
2. If my plants have stalled and haven't grown for weeks, will they recover?
 - a. Possibly, refer to Troubleshooting

System Upgrades & Expansion

1. Can I expand my Under Current system?
 - a. Yes, contact us.
2. Can I upgrade my Water and Air Pump(s)?
 - a. Yes, contact us for more info.

CCH2O WARRANTY

Current Culture H2O Limited 3-Year Warranty

This limited warranty applies only to full systems manufactured at Current Culture H2O in Fresno, CA.

Warranty Includes

- All individual components manufactured by Current Culture H2O come standard with a THREE year limited warranty.
- All Air & Water pumps are covered by their specific manufacturer's warranty. Manufacturer instructions and warranty information booklets are provided with each pump. If any issues with these units covered within their individual warranties should occur, please contact the manufacturer for repair or replacement.

Warranty Excludes

- This limited warranty excludes any components considered to be expendable (i.e. hoses, air diffusers, net pots, seals, etc.). These items should be replaced periodically to ensure proper system functionality.

Warranty Returns & RMA

Current Culture H2O will replace the product, repair the product or send a replacement part or issue a refund (at our option) when the consumer provides a proof of purchase (either a bill of sale, receipted invoice, or other proof that the product is within the warranty period), along with a full description of the defect, to:

Current Culture H2O, 4333 S. Minnewawa Ave #101, Fresno, CA 93725, (559)266-4769, info@cch2o.com

Current Culture H2O reserves the right to request photographic proof of product defect, and request that the defective product in question be shipped to Current Culture H2O to verify the defect or to aid in quality control efforts.

All warranties must be preceded by an authorized RMA form. If a replacement is issued, Current Culture H2O does not cover the cost of shipping replacement items. Customer will be notified of shipping charges for approval and payment information prior to issuing replacement items.

Legal Info

Misuse, or use other than for horticultural purposes is not covered by the limited warranty. In addition, damage caused by: insects, animals or rodents, use of force, incorrect handling, inappropriate use, abuse, neglect, accidents, impact from foreign objects, vandalism, pollutants, set-up on an un-level foundation, alteration, painting, fading, assembly not in accordance with the System Assembly Instructions, or damage caused as a result of storage above the capacity limits of the Product, are not covered by this limited warranty.

This limited warranty does not apply to damage resulting from "acts of nature" such as, but not limited to: wind, hail, storm, tornado, hurricane, heavy snow, ice, blizzard, extreme heat, freezing, flood, fire effects.

This warranty is void if structural parts and/or components not supplied by Current Culture H2O are used.

This warranty does not apply to "Normal Weathering". "Normal Weathering" is defined as exposure to sunlight and extremes of weather and atmosphere, which will cause any colored surface to gradually fade, chalk, or accumulate dirt or stains.

CURRENT CULTURE H2O MAKES NO OTHER WARRANTIES, EXPRESS OR IMPLIED, CONCERNING THE PRODUCT OR THE MERCHANTABILITY OR FITNESS THEREOF FOR ANY PURPOSE. IN NO EVENT SHALL CURRENT CULTURE H2O BE LIABLE FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES. Legal rights vary from state to state, so the above limitations may not apply to you if precluded by local law.

Determination of coverage under this warranty shall be made at the sole discretion of Current Culture H2O.

DISCLAIMER

This system operates by storing and circulating water.

Water is heavy. Water is wet. Water freezes. Water and electricity could lead to electrocution.

It is the responsibility of the user of this system to make sure the surface upon which the system is installed is capable of supporting SUBSTANTIAL weight and is waterproof, and that all electrical components are install so that they will not get wet.

Current Culture H2O will NOT be responsible for any damage caused by improper installation or consequential damage to person or property caused by the use of this product even if it is determined to be defective.

Please take these warnings into consideration when planning your installation.
