

Tips for Using The Amazing Doctor Zymes Eliminator Successfully

To successfully use Eliminator for pest and mildew control, we recommend that the water you are adding be 78 to 90 degrees F. Cold water works, but it takes longer to see the results. pH is also an important factor. We recommend your pH to be between 6.0 and 7.0 before adding Eliminator ***Do not adjust your pH after you add Eliminator.***

Eliminator can be used as a soil drench or as a foliar spray. It can be used for insects or for fungal issues in your soil. It can be used as a preventative or you can use it to eliminate infestations. We believe prevention is the key to success.

Preventative Measures before Planting:

Before you amend your soil for the season, apply 1 cup of Eliminator to 5 gallons of warm water, add more water after you apply so product can penetrate the soil. This will ensure that you rid your soil of insects, eggs, larvae, molds and mildews.

Preventative Measures for Propagation:

Before starting your seeds, spray them with Eliminator at a rate of 1 oz. per quart of warm water. This will help fight damping off and any other fungal issues. It will also speed up the propagation time. You can also use it when you take your cuttings. You can foliar feed or water into your medium at a rate of 1/2 oz. per quart of warm water. This will prevent pest problems and fungal problems and ensure a higher rate of success.

Preventative Measures during Growing Season:

Foliar spray your plants once per week up to the day of harvest. Spray your plants and entire area around them and any other vegetative growth in or near your garden. We recommend ½ cup of Eliminator to 1 gallon of warm water as a preventative.
