

# How To Use Nematodes The Right Way

- Release in the morning or evening.
- Avoid direct sunlight.
- Cloudy Days are perfect all day.

- Irrigate soil before application.

- Add Nematodes into a bucket containing 1-5 gallons of tap water. 59-69°F. Do not use highly chlorinated water.
- Dilute to make volume that your application apparatus requires for coverage.
- The amount of water is not critical.

- Stir well and leave the solution to soak for 20-30 seconds.
- Once activated nematodes must be released within 6 hours.

- Apply to soil with watering can, feeding system, hose end sprayer, pump sprayer or application apparatus.
- To avoid blockage all filters should be removed.

- Do not mix with pesticides.

**72 PSI MAX**

- Pressure should not exceed 72 psi.
- Nozzle diameter must be 0.8 mm minimum.

- Soil temperature of 44°- 83°F is optimal.

- Irrigate immediately after application.
- Avoid Run-off.
- If soil temperatures are higher than 86°F, irrigate with at least 0.1 inch of water before and after applying.
