Thank You for Choosing to Use Cultured Biologix & Nectar For The Gods!

This regimen was designed specifically for Nectar users to have a chart to follow on their "Tea Days" in between feeds. It incorporates the "auxiliary" Nectar products into an easy microbial tea for every grower to have the most effective Tea Days throughout their grow cycle.

This tea regimen is a good starting point, but every gardener is different so we suggest you use this as a baseline and develop your own custom twist to your "Tea Day" in between your feeds.

The amounts listed in the tea regimen are the amount you should use for each gallon of water in your tea mixture.

Please shake bottles well before pouring and make sure to mix throughout the application process to prevent any settling.

Detailed instructions, how-to videos and helpful information are available at our websites, www.ocgfam.com or at www.culturedbiologix.com

Notes: When it comes to microorganisms, pH is the most sensitive aspect of living and germinating colonies of beneficial bacteria. Harsh pH swings can impact the microbial development of any compost tea, so it is recommended to dilute the Nectar products first, and then pH your solution. After you achieve the desired pH (6.5 to 7.5 pH), add the Cultured Teas to the mixture and apply to your plants.

Use or discard mixed Nectar/Culture solution within 24 hours of dilution. The Nectar will start to bind up and bacteria require oxygen to survive. Stagnant water will suffocate the microbial population and make the Nectar products unavailable to the plant.

If problems arise with pH or PPM, perform a Herculean Harvest flush with Olympus Up to tie up any excess PPM and neutralize acids to bring your pH back in range. Best course of action after a flush is to treat it like a "Tea Day" and then continue feeding after the pH/PPM is in balance after the "Tea Day".
