RELEASE INSTRUCTIONS

1. Once Leafminer-feeding marks are present, releases should be planned.
2. It is best to release the Diglyphus when the first Leafminer larvae are found.
3. Approximately 1 Diglyphus should be released per 10 sq. ft., weekly, for several weeks since the Leafminer pest has a short period of vulnerability to the Diglyphus Wasp.
4. Release Diglyphus as soon as possible after receipt.
5. Best if released in the evening.
6. Simply open the container – walk through the area and allow the Wasps to fly out of the container.

Storage: Release as soon after receipt as possible. If not releasing immediately, keep in outer box in a cool (42-50°F) place out of direct sunlight.

Strategic Considerations: Many pesticides will have a negative effect on the development of Diglyphus. Avoid the use of systemic insecticides or pesticides with long residual action.
